CLASS 9 • SST • EXAM WORKBOOK

ECONOMICS

the Workbook

Poora exam prep — samajhne wali **Hinglish notes**, likhne wale **English points**, saare **definitions**, aur full **practice set** (MCQs + big Q&A). All from your textbook, nothing extra.

8 **Building Blocks in Economics**
The Problem of Choice — scarcity, opportunity cost, PPC, 3 key questions, economic systems

9 **The Price Puzzle: What Drives the Market**
Demand, supply, market equilibrium & the role of government

💡 Hinglish Samajh · ✍️ Exam-Ready Points · 📖 Definition Bank · ✅ 10 + 10 MCQs · 📝 10 + 10 Big Q&A · 🎯 Under 20 Pages

Let's go! 🚀

1 · SAMAJH
Pehle 💡 Hinglish box padh — topic ka feel aa jayega

2 · RATTAAA
📖 Definition + ✍️ points yaad kar — yehi likhne ke hain

3 · TEST
MCQs khud solve kar, phir answers check kar 💪

4 · WRITE
Big Q&A dekh — points ko apne answers me copy-paryog karo

CHAPTER 8 • ECONOMICS

Building Blocks in Economics: The Problem of Choice

Economics = choices ki science. Resources kam, wants unlimited — toh choose karna padta hai. Is chapter me: scarcity, opportunity cost, PPC, 3 key questions aur economic systems.

🔑 12 Topics | 📖 20+ Definitions | ✅ 10 MCQs | 📝 10 Q&A

📚 Notes — Har Topic, Poori Samajh

T1 Economics — What is it? 🤔

☐ revised

📖 **DEFINITION**

Economics is the discipline that deals with how choices are made by **optimising (best use of)** limited resources to satisfy the **needs and wants** of people.

💡 **SAMAJH (HINGLISH)**

Word aaya hai Greek se — **oikonomia** = **oikos** (household) + **nemein** (management) = **"household management"**. Simple: jaise ghar me mummy paise limited hote hain aur unse poora month chalati hain — wahi economics hai, bas poore desh ke level pe! Government, companies, families — sabko yahi problem hoti hai: **kam resources, zyada demands**.

✍️ **EXAM POINTS — YEHI LIKHNA HAI**

- **Origin:** Greek word **oikonomia** — oikos (household) + nemein (management), meaning 'household management'.
- Economics studies how **individuals, enterprises and governments** make choices to use limited resources efficiently.
- It explains how **economic entities** — consumers, producers, governments, financial institutions — interact in an economy.
- It covers: how people earn wages, how wealth is distributed, how prices are determined, how policies & trade affect employment.
- Good economic decisions are based on **data and analysis** — not guesswork (data = facts & statistics; surveys = systematic data collection).

T2 Needs vs Wants 🍚 vs 🎮

☐ revised

📖 **DEFINITIONS**

Needs — essentials required for survival, like food, water and shelter. | **Wants** — desires beyond essentials, like gadgets, vacations and luxury items.

💡 **SAMAJH (HINGLISH)**

Need = bina ye zinda nahi reh sakte (khana, paani, ghar). **Want** = dil ki demand — cycle se bike, bike se car, car se... aur badhte hi jao! 🚲→🏍️→🚗 Isliye kehte hain **"human wants are unlimited and keep changing"** — yahi economics ki root problem hai.

✍️ **EXAM POINTS**

- **Needs** are essential for survival — food, water, shelter.
- **Wants** are unlimited, keep changing, and grow with time — e.g., bicycle → motorbike → car.
- Choices are made by individuals, enterprises and governments — e.g., spending pocket money on snacks vs saving for shoes.
- Since wants exceed resources, **every economic choice involves giving something up**.

🧠 **Quick trick:** Need = **N**ahi hua toh **N**ahi bachoge. Want = **W**ish list — hoga toh mast, nahi toh chalega!

T3 Scarcity & Resources — The Root Problem 🥲

☐ revised

📖 **DEFINITIONS**

Resources — factors used for the production of goods and services; they can be natural (water, coal) or human-made (capital, technology). | **Scarcity** — the condition of limited resources against unlimited wants.

💡 **SAMAJH (HINGLISH)**

Ek hi **steel** ka block — usse hospital ke **medical equipment** bana sakte ho, **fridge** bhi, **aircraft** bhi. Steel kam hai, uses bahut saare — matlab resources ki **alternative uses** hain. Toh economy ko decide karna padta hai kahan lagana hai. Yahi **scarcity** hai — aur isi se **choice** ka problem paida hota hai.

✍️ **EXAM POINTS**

- Both natural and human-made resources are **limited in quantity**.
- Resources have **many alternative uses** — e.g., steel can make medical equipment, refrigerators or aircraft.
- **Factors of production** (Grade 8 recap): **Land, Labour, Capital, Technology**.
- Not just households — whole **economies** must decide how to use scarce resources to improve people's quality of life.
- Scarcity + unlimited wants → **choices** → every choice has a cost (next topic!).

T4 Opportunity Cost — What You Give Up 💸

☐ revised

📖 **DEFINITION**

Opportunity cost — the **value of what is given up** when one alternative is chosen and the other options are sacrificed.

💡 **SAMAJH (HINGLISH)**

Friday evening: movie **ya** cricket match — dono ek saath nahi. Movie chuni toh **match ka maza** gaya = movie ka opportunity cost. Book example: farmer ke paas ek piece of land — usme **barley ya wheat** ugaa sakta hai. Barley boya toh wheat ka sacrifice = barley ka opportunity cost. Yaad rakhna: **jo chhoda, wahi cost hai!**

✍️ **EXAM POINTS**

- When one alternative is chosen, the other options are **given up** — their value is the opportunity cost.
- **Farmer example:** with limited land, water and labour, he can grow barley or wheat in different combinations — more barley means less wheat.
- Opportunity cost applies to **households, enterprises and governments** alike (e.g., govt: highways vs hospitals).
- Understanding it improves decision-making — we compare what we gain against what we sacrifice.

🧠 **Exam line:** "Every economic choice has an opportunity cost" — 1-mark question me seedha likh do. ✔️

T5 Production Possibility Curve (PPC) 📉

☐ revised

📖 **DEFINITION**

PPC — the curve showing **different combinations of two goods** that can be produced using **all available resources** efficiently.

💡 **SAMAJH (HINGLISH)**

PPC ek **seesaw** jaisa hai — ek side barley, doosri side wheat. Ek side ka weight badhaya toh doosri girti hai! Graph me x-axis pe **barley (kg)**, y-axis pe **wheat (kg)**, aur curve **neeche ki taraf jhuki (downward sloping)** hoti hai — kyunki zyada barley chahiye toh wheat sacrifice karni padegi. **A se E** tak move karo → barley badhti hai, wheat ghat-ti jaati hai.

✍️ **EXAM POINTS**

- PPC shows the **trade-off** between two goods (here: barley and wheat).
- It is **downward sloping** — producing more of one good requires sacrificing some of the other.
- **Points ON the curve** = maximum output with **efficient use of resources** (no wastage).
- It helps **enterprises and governments** in better planning and decision-making.

Combination	Barley (kg)	Wheat (kg)	Kya ho raha hai?
A	0	100	Sirf wheat, no barley
B	25	90	Thodi barley → 10 kg wheat gaya
C	50	70	Barley badhi → wheat ghati
D	75	40	Aur barley → aur sacrifice
E	100	0	Full barley, zero wheat

T6 3 Key Questions — KYA produce karein? ❓

☐ revised

💡 **SAMAJH (HINGLISH)**

Har economy — India ho ya America — ko 3 sawaal ka jawab dena hota hai: **KYA produce karein? KAISE produce karein? KISKE LIYE produce karein?** Scarcity ki wajah se yeh 3 questions compulsory hain — resources kam hain, toh decide karo kahan, kaise aur kiske liye lagana hai! Pehla sawaal dekhte hain 👇

✍️ **EXAM POINTS — Q1: WHAT TO PRODUCE?**

- Which goods & services, and in what quantities, should be produced to meet the economy's needs.
- **Example:** water-intensive crops (sugarcane, paddy) vs drought-resistant crops (millets, pulses).
- Sugarcane = high profit + supports sugar industry; millets = save water + improve soil health + sustainable agriculture.
- Here **opportunity cost of sugarcane** = forgone gains from saved water and improved soil health — a trade-off between **short-term profit and long-term sustainability**.

T7 3 Key Questions — KISKE LIYE produce karein? 🎯

☐ revised

✍️ **EXAM POINTS — Q2: FOR WHOM TO PRODUCE?**

- Since people have different needs, incomes, tastes and lifestyles — producers decide **which group of consumers to serve**.
- **Shoes example:** School shoes (simple, durable, affordable) • Office shoes (comfort, formal, leather) • Sports shoes (rubber soles, lightweight, grip & support) • Casual slippers (comfortable, affordable).
- Leather shoes → office-goers & higher-income customers; rubber/synthetic → sports players, factory workers (affordable + durable).
- Producers study what consumers like, their income and demand — so resources are **not wasted**.

T8 3 Key Questions — KAISE produce karein? ⚙️

☐ revised

✍️ **EXAM POINTS — Q3: HOW TO PRODUCE?**

- Which methods, resources and technologies to use — the right mix of factors of production.
- **Labour-intensive** = more workers, less machinery (agriculture, handicrafts). **Capital-intensive** = more machines & technology, fewer workers (steel, automobile industries).
- The choice depends on: **cost of capital, technology available, nature of product** (customised clothes need skilled labour; mass production suits machines), **availability & cost of labour**, and **government laws & regulations**.
- **Garment example:** machines mehngi → labour; machines sasti → automation. Designer clothes = skilled labour; mass garments = machines.

T9 Economic Systems — 3 Tarika 🏛️

☐ revised

📖 **DEFINITION**

Economic system — the system that defines the mechanisms for the **production, consumption and distribution** of goods, services and resources in a country.

💡 **SAMAJH (HINGLISH)**

3 systems = 3 personalities 😄 — **Planned**: "Sarkar sab decide karegi" (strict papa 🧔). **Market**: "Demand-supply khud decide karega, sarkar bas referee" (cool referee 🏃). **Mixed**: "Dono mil ke" — India wala practical combo (office me dono bosses 👨‍💼👩‍💼). Har system wahi 3 questions (kya/kaise/kiske liye) alag tarah se answer karta hai.

✍️ **EXAM POINTS — THE 3 SYSTEMS**

- **Planned economy:** a **central planning authority** of the government (like a planning commission) makes all major decisions — what, how much, how, for whom and at what prices. Government owns most resources (land, factories, banks, transport). Strict **permits & licenses** → little competition → less motivation to improve quality or innovate. **Examples: former Soviet Union, North Korea, Cuba.**
- **Market economy:** decisions are made mainly by **forces of demand and supply** with little government intervention — government acts like a **referee** (safety, law & order; does not control prices or production). Ownership largely with **individuals & private companies**. Competition → better quality, lower prices, innovation. **Examples: USA, Japan, Hong Kong.**
- **Mixed economy:** combines features of both — private individuals, enterprises AND the government play important roles. Large **public sector companies** exist alongside private players. In reality, **almost all economies are mixed**. **Examples: India (post-1991), China (post-1978), Germany, Sweden.**

Basis	Planned 🧔	Market 🏃	Mixed 🤝
Who decides?	Central govt authority	Demand & supply forces	Both govt + market
Ownership	Mostly government	Mostly private	Private + public sector
Competition	Very limited (permits, licenses)	High → innovation	Regulated competition
Examples	Former USSR, North Korea, Cuba	USA, Japan, Hong Kong	India, China, Germany, Sweden

T10 India's Economic Journey 🇮🇳

☐ revised

💡 **SAMAJH (HINGLISH)**

Independence ke baad India **"sarkari style"** me chala — licenses, permits, sarkari banks, sarkari factories. Phir **1991** me economy struggling hui (serious economic difficulties) — toh government ne **big reforms** ki: nakhre kam, competition zyada! Aaj India ek **market-oriented mixed economy** hai — private players bhi, sarkar bhi. 🚀

✍️ **EXAM POINTS**

- **After Independence:** India followed a **state-led approach** similar to a planned economy — government controlled industries, allocated resources, regulated production through **licenses & permits**; banking, transport & heavy industries dominated by the **public sector**.
- **By 1991:** the country faced **serious economic difficulties**.
- **Reforms of 1991:** reduced excessive regulations, encouraged **private enterprise**, opened the economy to **global trade & investment**, and increased **competition**.
- Result: India gradually shifted towards a more **market-oriented system** while retaining an important role for the government → today a **mixed economy**.

T11 Economic Survey & Economists' Work 📊

☐ revised

📖 **DEFINITION**

Economic Survey of India — an important **annual document** prepared by the **Ministry of Finance** and presented in **Parliament before the Union Budget**.

💡 **SAMAJH (HINGLISH)**

Economic Survey = desh ki **report card** 📔 — pichle saal economy kaisi rahi (agriculture, industry, services, jobs, inflation...). Budget se pehle Parliament me pesh hoti hai, isliye ise **Union Budget ka blueprint** bhi kehte hain. Aur economists kya karte hain? Data analyse kar ke **policy, finance, research, consulting** — chaar departments me kaam.

✍️ EXAM POINTS — ECONOMIC SURVEY

- Annual document by the **Ministry of Finance**, presented in Parliament **before the Union Budget**.
- Reviews the country's **economic performance** of the past year and analyses sectors — agriculture, industry, services, employment, inflation, education, health, infrastructure.
- Discusses future **challenges and opportunities**; acts as a **blueprint for the Union Budget**; explains economic data clearly to citizens.

✍️ EXAM POINTS — SCOPE OF ECONOMISTS' WORK

- **Policy-making:** guiding governments on taxation or welfare spending.
- **Finance:** advising investors on where to invest.
- **Research & education:** studying economic trends and teaching.
- **Business consulting:** helping firms plan growth or improve efficiency.
- They use data from **government reports, economic surveys and companies' financial statements** to weigh alternatives, opportunity costs and potential outcomes.

T12 Quick Recap — One Shot ⚡

☐ revised

- **Unlimited wants** + **limited resources** = **SCARCITY** → **CHOICES** → every choice has an **opportunity cost**.
- **PPC** = trade-off between two goods; points on it = maximum efficient output.
- **3 key questions:** What to produce? How to produce? For whom to produce?
- **3 systems:** Planned (govt decides — N. Korea, Cuba) • Market (demand-supply decides — USA, Japan) • Mixed (both — India).
- **India:** state-led after Independence → **1991 reforms** → market-oriented mixed economy.
- **Economic Survey** = annual report card by Finance Ministry, before the Budget.

📖 Definition Bank — Chapter 8, Part 1 (likhne ke liye ready) 📖

Economics — study of how choices are made to optimise limited resources for satisfying needs & wants.

Needs — essentials for survival: food, water, shelter.

Wants — desires beyond essentials; unlimited and ever-changing.

Scarcity — the problem of limited resources vs unlimited wants.

Resources — factors used to produce goods & services (natural or human-made).

Factors of production — land, labour, capital, technology.

Opportunity cost — value of the next best alternative given up when a choice is made.

PPC — curve showing combinations of two goods producible with all available resources.

Market — place (physical or virtual/internet) where buying & selling of products and services takes place.

Economy — the system of production, distribution, trade and consumption of goods & services in an area.

Economic entities — participants in economic activity: producers, consumers, government, enterprises.

Economic system — mechanism defining production, consumption & distribution of goods, services and resources.

Planned economy — resource allocation & prices determined by the government.

Market economy — resource allocation & prices determined primarily by market forces.

Mixed economy — government & private sector coexist and compete; private players are regulated.

Public goods — goods available to all without exclusion (parks, roads, police, street lights, basic education).

📖 Definition Bank — Chapter 8 (Part 2) 📖

Labour-intensive — production using more workers and less machinery.

Capital-intensive — production using more machines/technology and fewer workers.

Policy — a course or principle of action adopted by an organisation or government.

Data — facts and statistics collected for reference or analysis; **Surveys** — systematic collection of such data.

✅ MCQ Challenge — 10 Questions

🎯 Solve karne ke baad score bharo → ____ / 10

Q1. The word 'Economics' comes from the Greek word *oikonomia*, which means —

a) wealth creation
b) household management
c) study of markets
d) pricing of resources

Q2. Which of the following is a need and not a want?

a) gaming console
b) vacation abroad
c) drinking water
d) designer shoes

Q3. The basic economic problem arises because —

a) wants are limited, resources are unlimited
b) wants are unlimited, resources are limited
c) both wants and resources are limited
d) both wants and resources are unlimited

Q4. When you choose one alternative, the value of the option given up is called —

a) total cost
b) marginal cost
c) opportunity cost
d) fixed cost

Q5. The Production Possibility Curve (PPC) shows —

a) profit margins of firms
b) combinations of two goods produced using all resources
c) the demand schedule of a consumer
d) growth of population

Q6. Which of these is NOT one of the three key questions of economics?

a) What to produce?
b) How to produce?
c) For whom to produce?
d) When to consume?

Q7. In a planned economy, major economic decisions are taken by —

a) market forces of demand & supply
b) the central planning authority of the government
c) consumers through voting
d) large private corporations

Q8. Which of the following is best described as a market economy?

a) North Korea
b) Cuba
c) Japan
d) former Soviet Union

Q9. India's economic reforms of 1991 —

a) increased licences and permits
b) reduced regulations & opened the economy to global trade
c) nationalised all private banks
d) banned private enterprise

Q10. A good whose use by some people does not prevent others from using it (e.g., parks, street lights) is a —

a) luxury good
b) substitute good
c) public good
d) complementary good

🔑 Answer Key — Chapter 8

1 → b | 2 → c | 3 → b | 4 → c | 5 → b | 6 → d | 7 → b | 8 → c | 9 → b | 10 → c

- **1:** oikos (household) + nemein (management) = household management.
- **2:** Needs are survival essentials — food, water, shelter; rest are wants.
- **3:** Unlimited wants + limited (scarce) resources = the central problem → choices.
- **4:** Opportunity cost = value of what is given up when choosing an alternative.
- **5:** PPC = combinations of two goods with all resources used efficiently.
- **6:** The three questions are what, how, for whom — "when to consume" is not one.
- **7:** Planned = central authority (govt) decides what/how/for whom & prices.
- **8:** Japan is a market economy (USA, Hong Kong too); others are planned.
- **9:** 1991 reforms reduced excessive regulations, encouraged private enterprise, opened trade.
- **10:** Public goods are non-excludable — parks, roads, police, street lights.

📝 Big Questions — Exam-Ready Answers (points me)

Q1. What is economics? Explain its origin and what it deals with.

ANSWER

- Economics is the discipline that deals with how **choices are made by optimising limited resources** to satisfy needs and wants.
- The word comes from the Greek **oikonomia** — **oikos** (household) + **nemein** (management) — meaning 'household management'.
- Just as families must plan with limited income, **nations** must plan how to use resources efficiently.
- It studies how economic entities — **consumers, producers, governments, financial institutions** — interact in an economy.
- It explains wages, distribution of wealth, price determination, and the effect of policies and trade on markets and employment.
- Good economic decisions are based on **data and analysis**, not guesswork.

Q2. Distinguish between needs and wants. Why can all wants not be satisfied?

ANSWER

- **Needs** are essentials for survival — food, water, shelter.
- **Wants** are desires beyond essentials — gadgets, vacations, luxury items.
- Wants are **unlimited and keep changing** — a person may upgrade from bicycle → motorbike → car.
- All wants cannot be satisfied because **resources are limited** in quantity.
- Hence individuals, enterprises and governments must constantly **choose** — and every choice sacrifices an alternative.

Q3. What is scarcity? Why is it called the central problem of economics?

ANSWER

- Scarcity is the condition where **resources are limited** while **human wants are unlimited**.
- Both natural resources (water, coal) and human-made resources (capital, technology) are limited in quantity.
- Resources also have **competing/alternative uses** — e.g., steel can make medical equipment, refrigerators or aircraft.
- Because of scarcity, every economy must answer **what, how and for whom to produce**.
- Thus scarcity forces **choice**, and every choice creates an **opportunity cost** — making it the central problem of economics.

Q4. Explain the concept of opportunity cost with the farmer's example.

ANSWER

- Opportunity cost is the **value of what is given up** when one alternative is chosen over others.
- A farmer with a piece of land can grow either **barley or wheat**.
- With limited land, water and labour, he must decide **how much of each crop** to produce.
- When he moves from combination A to E (growing more barley), **some wheat must be sacrificed** — this sacrifice is the opportunity cost of growing barley.
- Opportunity cost applies to all decision-makers — households (pocket money), enterprises, and governments (highways vs hospitals).

Q5. What is the Production Possibility Curve? What do the points on the curve show?

ANSWER

- The PPC is the curve showing **different combinations of two goods** that can be produced using **all available resources**.
- It shows the **trade-off** between the two goods — e.g., barley and wheat.
- It is **downward sloping**: producing more of one good requires sacrificing the other.
- All points **on the PPC** show the **maximum output** achievable through **efficient use of resources**, avoiding wastage.
- It helps enterprises and governments in **better planning and decision-making**.

Q6. Explain the three key questions that every economy must answer, with examples.

ANSWER

- **What to produce?** — which goods and services, and in what quantities; e.g., water-intensive sugarcane/paddy vs drought-resistant millets/pulses; choosing sugarcane means giving up the gains of saved water and soil health (opportunity cost).
- **For whom to produce?** — which group of consumers to serve; e.g., school shoes (simple, durable, affordable), office shoes (formal, leather), sports shoes (grip, lightweight) — produced for different needs and purchasing power.
- **How to produce?** — choice of technique: **labour-intensive** (agriculture, handicrafts) or **capital-intensive** (steel, automobiles); depends on cost of capital, technology, product type, labour availability and government regulations.
- All three arise from **scarcity** — limited resources must be allocated among unlimited wants.

Q7. Compare the three types of economic systems.

ANSWER

- **Planned economy:** a central planning authority of the government makes all major decisions — what, how, for whom, and prices; government owns most resources; strict permits and licenses restrict competition and reduce motivation to innovate. Examples: former Soviet Union, North Korea, Cuba.
- **Market economy:** decisions are driven by **demand and supply** with little government intervention; the government acts like a **referee** ensuring safety and law & order; private ownership dominates; competition brings better quality, lower prices and innovation. Examples: USA, Japan, Hong Kong.
- **Mixed economy:** combines both — private players and the government coexist and compete; large public sector companies operate alongside private enterprises; private players are regulated. Examples: India (post-1991), China (post-1978), Germany, Sweden.
- In reality, **almost all economies are mixed** — pure systems rarely exist.

Q8. Why do pure market or pure planned economies rarely exist? Why is a mixed economy considered more practical?

ANSWER

- A pure **planned** system restricts competition — few enterprises, less innovation, and the government may fail to match production with people's needs.
- A pure **market** system can produce unfair outcomes — markets allocate goods by ability to pay, so essentials may become unaffordable for vulnerable groups.
- A **mixed economy** combines strengths — private enterprise brings competition, innovation and efficiency; government brings welfare programmes, public goods, fair competition rules and consumer protection.
- It allows flexibility — the degree of government involvement can adjust to the country's needs (e.g., India's shift after 1991).
- Hence almost all real economies — even the USA and Singapore — are mixed in practice.

Q9. Describe India's economic journey since Independence.

ANSWER

- After Independence, India followed a **state-led approach** similar to a planned economy.
- The government controlled industries, allocated resources and regulated production through **licenses and permits**.
- Key sectors — **banking, transport, heavy industries** — were dominated by the public sector.
- By **1991**, the country faced serious economic difficulties.
- The government introduced major **reforms**: reduced excessive regulations, encouraged private enterprise, opened the economy to global trade and investment, and increased competition.
- Result: India gradually became a **market-oriented mixed economy** with the government still playing an important role.

Q10. What is the Economic Survey of India? What is the scope of economists' work?

ANSWER

- The Economic Survey is an important **annual document** prepared by the **Ministry of Finance**.
- It is presented in **Parliament before the Union Budget**.
- It reviews the past year's economic performance and analyses sectors — agriculture, industry, services, employment, inflation, education, health, infrastructure.
- It discusses future challenges and opportunities and acts as a **blueprint for the Union Budget**.
- **Scope of economists' work:** policy-making (taxation, welfare), finance (advising investors), research & education (studying trends, teaching), and business consulting (helping firms plan growth and efficiency).

CHAPTER 9 • ECONOMICS

The Price Puzzle: What Drives the Market

Mehngai ka khel — kaun control karta hai? Do badi taqtein: **demand** aur **supply**. Is chapter me: laws of demand & supply, market equilibrium, aur sarkar ka role — price ceiling, price floor, public goods.

🔑 10 Topics | 📖 20+ Definitions | ✅ 10 MCQs | 📝 10 Q&A

📚 Notes — Har Topic, Poori Samajh

T1 Demand — Chahna + Khareed Paana 🛒

☐ revised

📖 **DEFINITION**

Demand — the quantity of a product that people are **willing AND able** to buy at a **particular price**, depending on their needs, preferences, season, trend and income.

💡 **SAMAJH (HINGLISH)**

Sirf chahna demand nahi hai! Ferrari chahiye sabko 🏎️ but khareedne ki **purchasing power** kisi ke paas nahi. Demand = **desire + ability to pay**. Aur ye price pe depend karti hai — sasta hai toh zyada log khareedte hain, mehnga hai toh kam. Isi ko agla topic me law me dekhte hain.

✍️ **EXAM POINTS**

- Demand = **willingness + ability (purchasing power)** to buy at a particular price.
- It is **not just desire** — desire without purchasing power is not demand.
- Depends on: needs, preferences, **season, trend and income**.
- **Purchasing power** — a measure of how much one unit of currency can buy at a particular time.

T2 Law of Demand — Utaavla Seesaw 📉

☐ revised

📖 **DEFINITION**

Law of Demand — as the price of a product **rises**, its quantity demanded **falls**; as price **falls**, quantity demanded **rises** — an **inverse relationship** (other factors constant).

💡 **SAMAJH (HINGLISH)**

Aam (mango) season shuru — **₹150/kg** → Srivalli sirf **1 kg**. Supply badhi, price **₹100** → **2 kg**. Full season me **₹50** → **3 kg**! 🥭 Matlab: price neeche, demand upar — **ulta relation**. Isko graph pe draw karo toh curve **neeche ki taraf jhukti** hai (downward sloping).

✍️ **EXAM POINTS**

- Price ↑ → quantity demanded ↓; price ↓ → quantity demanded ↑ — **inverse relationship**.
- **Individual demand** — quantity one consumer wants to buy at different prices (other factors constant).
- The table of price–quantity is the **demand schedule**; drawn on a graph it becomes the **demand curve** (DD').
- The demand curve slopes **downward** from left to right.

Price of mango/kg	Srivalli buys	Point on curve
₹150	1 kg	A
₹100	2 kg	B
₹50	3 kg	C

T3 Individual vs Market Demand + Curve 📊

☐ revised

📖 **DEFINITIONS**

Individual demand — quantity one consumer buys at different prices. | **Market demand** — the **sum of all individual demands** at each price.

💡 **SAMAJH (HINGLISH)**

Srivalli + Alex + Israt — teeno ki demand **add** karo = market demand. 🧱 ₹50 pe: Srivalli 3 + Alex 6 + Israt 9 = **18 kg**. Ek interesting baat (book me bhi): market demand curve individual curve se **flatter** hoti hai — kyunki ek price change pe itne saare log react karte hain ki total quantity response **bada** hota hai!

✍️ **EXAM POINTS**

- Market demand = **Q1 + Q2 + Q3 + ...** (sum of all individual demands at each price).
- Plotting market demand at different prices gives the **market demand curve** (DmDm').
- The market demand curve is **flatter** than an individual curve — the same price change creates a **larger total quantity response** (₹150→₹50: Srivalli +2 kg, but market +12 kg).

Price	Q1 (Srivalli)	Q2 (Alex)	Q3 (Israt)	Market Demand
₹150	1 kg	2 kg	3 kg	**6 kg**
₹100	2 kg	4 kg	6 kg	**12 kg**
₹50	3 kg	6 kg	9 kg	**18 kg**

T4 Demand ke Determinants (price ke alawa) 🎛️

☐ revised

💡 **SAMAJH (HINGLISH)**

Price same rahe, phir bhi demand badal sakti hai — kyunki aur bhi factors hain: **related goods** (substitute/complement), **income**, **taste**, **population**, **season**, **future expectations**. Jaise: coffee mehngi hui toh log **chai** peene lage (substitute!). Petrol mehnga toh **car ki demand giri** (complement!). 🚗⛽

✍️ EXAM POINTS — SAB DETERMINANTS

- **Price of related goods — Substitute goods** replace each other (tea ↔ coffee, mangoes ↔ bananas): price of one ↑ → demand for the other ↑. **Complementary goods** are used together (car + petrol, printer + cartridges, movie ticket + popcorn): price of one ↑ → demand for the other ↓.
- **Income:** when household income rises, consumers buy more or better quality → quantity demanded rises (prices constant).
- **Taste & preference:** personal likes decide demand — Srivalli loves mangoes and won't substitute oranges even if cheaper.
- **Population size & composition:** India = most populous nation → huge domestic demand. More children → sports shoes; more working adults → formal shoes; more elderly → comfortable/orthopaedic shoes.
- **Seasonality:** demand changes with weather, festivals, habits — bookshops at new session, sweets in festive season, sweaters in winter.
- **Future price expectations:** expect prices to fall → postpone purchases (demand ↓ now); expect rise → buy immediately (demand ↑ now) — e.g., waiting for Diwali/New Year discounts.

📖 BONUS DEFINITION

Diminishing marginal utility — the extra satisfaction (utility) from each additional unit keeps **falling** as we consume more. Pehla aam 😍, teesra aam 😐 — isliye willingness to pay bhi girti hai, aur demand price ke saath inverse me chalti hai.

T5 Supply & Law of Supply 📦

☐ revised

📖 DEFINITIONS

Supply — the quantity of a product that sellers are **willing and able to offer** at a particular price. | **Law of Supply** — as price **rises**, quantity supplied **rises**; as price falls, quantity supplied falls — a **direct relationship**.

💡 SAMAJH (HINGLISH)

Demand ka ulta! 💁 Seller ki soch: price zyada → **profit zyada** → zyada bechuga, aur naye firms bhi market me ghuseinge. Price kam → profit kam → supply bhi kam. Seller A: ₹50 pe 1 kg, ₹100 pe 2 kg, ₹150 pe 3 kg. Isliye supply curve **upar ki taraf** chadhti hai (upward sloping) 📈 — demand wali seesaw ka ulta.

✍️ EXAM POINTS

- Supply = willingness + ability of **sellers** to offer a product at a particular price.
- **Law of supply (direct relationship):** price ↑ → quantity supplied ↑ — higher prices increase profitability and attract new firms.
- **Individual supply** — quantity one seller offers at different prices; **market supply** — sum of all sellers (A+B+C = QS).
- The supply curve slopes **upward** (e.g., sellers A, B, C: at ₹50 supply 6 kg, ₹100 → 12 kg, ₹150 → 18 kg in total).
- Season logic: start of mango season — supply low → prices high; mid-season — supply ↑ → prices fall.

T6 Supply ke Determinants 🎚️

☐ revised

💡 SAMAJH (HINGLISH)

Price ke alawa supply bhi kai cheezo pe depend karta hai: farmer soch raha hai **wheat ya chana** ugaye (jo mehnga, wahi boyega!); market me **sellers zyada** toh supply zyada; **technology improve** hui (drip irrigation 🌱, cold storage) toh production badh ke supply bhi; aur **bhav badhne ki ummeed** hai toh aaj bechna rok lo (aalu wale dhaniye kar lete hain!).

✍️ EXAM POINTS

- **Price of related goods:** supply of one good depends on profitability of alternatives — wheat prices low but chickpea prices high → farmer grows more chickpeas next season.
- **Number of sellers:** more sellers → higher competition & production → market supply exceeds demand → prices fall. Fewer sellers → lower supply → prices rise.
- **Technology:** improvement reduces cost of production → producers make & supply more — e.g., drip irrigation, weather sensors raise crop output; cold storage lets mangoes reach distant markets, increasing supply.
- **Future expectations:** if producers expect higher demand/prices ahead, they produce more (supply ↑); expecting lower demand → cut production; e.g., potato wholesalers hold back stock to sell later at higher prices.

T7 Market Equilibrium — The Perfect Balance ⚖️

☐ revised

📖 **DEFINITION**

Market equilibrium — the point where **supply equals demand**; there is no excess supply (surplus) or excess demand (shortage), and prices remain stable unless external factors change.

💡 **SAMAJH (HINGLISH)**

Wo price jahan **buyers jitna khareedna chahte hain = sellers jitna bechna chahte hain**. Book example: **₹100 pe demand 12 kg = supply 12 kg** → EQUILIBRIUM! ✨ Is point pe market "cleared" ho jaata hai — na shortage, na surplus, aur price pe change ka koi pressure nahi. Graph me ye point **E** hai jahan demand curve supply curve ko kaat-ti hai.

✍️ **EXAM POINTS**

- Prices are determined by the **interaction of demand and supply** — negotiation between what buyers will pay and sellers will accept.
- **Equilibrium price = ₹100, equilibrium quantity = 12 kg** (chapter example) — where Qd = Qs.
- **At a lower price (₹40):** Qd (38 kg) > Qs (6 kg) → **excess demand** (shortage) → pressure for price to rise.
- **At a higher price (₹150):** Qs (43 kg) > Qd (8 kg) → **excess supply** (surplus) → pressure for price to fall.
- At equilibrium the market is **'cleared'** — no shortage, no surplus, no pressure to change.

Price	Qd (kg)	Qs (kg)	Condition	Outcome
₹40	38	6	Qs < Qd	**Excess Demand** (shortage)
₹100	12	12	Qs = Qd	**Market Equilibrium** ⭐
₹150	8	43	Qs > Qd	**Excess Supply** (surplus)

T8 Real World — Markets are Dynamic! 🌪️

☐ revised

💡 **SAMAJH (HINGLISH)**

Theory me equilibrium ek fixed point hai, but **real world me sab chalta rehta hai** — technology, wages, wars, elections, pandemic, mausam! 😵 Isliye market hamesha **ek naye equilibrium ki taraf adjust** karta rehta hai, kabhi settle nahi hota. COVID me masks 🏷️, aur Goa ke hotels — dono perfect examples.

✍️ **EXAM POINTS**

- In the real world, markets are **dynamic** — technology, wages, interest rates, wars, political events, pandemics, weather and disasters constantly change demand & supply.
- So equilibrium is **never stable** — the market always keeps adjusting towards a **new equilibrium**.
- **COVID-19 masks (2020):** demand surged rapidly → supply couldn't catch up → prices rose sharply → suppliers adjusted, prices fell → pandemic over → demand reduced → prices back to pre-pandemic levels.
- **Hotel tariffs (Goa, 100 rooms):** off-season weekday (July Monday) ₹1,500 • tourist-season weekend (December Saturday) ₹8,000 • New Year's Eve ₹25,000 — and a 40% overnight cut if a group booking cancels, to fill empty rooms.
- Tariff changes depend on: how fast rooms are booking, tariffs of nearby hotels, festivals/events, weather forecasts, days left before arrival, past booking trends.

T9 Role of Government — Referee Mode 🏛️

☐ revised

📖 **DEFINITIONS**

Price ceiling — an imposed price control setting the **maximum** price a seller can charge. | **Price floor** — an imposed limit on how **low** a price can go; to be effective it must be set **above the equilibrium price**. | **Monopoly** — a market with a **single seller** controlling the entire supply of a unique product, with no close substitutes.

💡 **SAMAJH (HINGLISH)**

Market hamesha fair nahi hota — dawai ₹5000 ho jaye toh? 😡 Tab sarkar referee banti hai: **ceiling** = chhat (upar ki limit — zyada mehnga nahi bech sakte, jaise sanitiser ₹100/200ml), **floor** = zameen (neeche ki limit — jaise minimum wage, taaki mazdoor ko loota na jaye). Ek akela seller poora market kaabu kare = **monopoly** — ye bhi sarkar check karti hai.

✍️ **EXAM POINTS — WHY & HOW GOVERNMENT INTERVENES**

- Markets allocate goods by **willingness & ability to pay** — essentials can become unaffordable, so fairness & equity are needed for **vulnerable, low-income groups**.
- **Price ceiling:** maximum prices for essential goods like medicines — prevents overcharging.
- **Price floor:** e.g., **minimum wage** — ensures workers earn enough; effective only **above equilibrium price**.
- **Monopoly** harms consumers — higher prices, poorer quality, restricted supply; government keeps price & quantity in check.
- **Regulators** ensure transparency: **RBI** (banking), **CCPA** (consumer rights & unfair trade), **TRAI** (telecom), **SEBI** (securities market).
- **COVID sanitiser case:** demand surged → hoarding & black marketing → government declared sanitisers essential under the **Essential Commodities Act, 1955**, capping MRP at **₹100 for 200 ml**; soon many companies started production and prices normalised.
- **Hoarding** — accumulating goods beyond immediate need (fear of shortage / expected price rise); **Black marketing** — illegal trade of banned or regulated goods.

T10 Public Goods + Limits of Intervention 🚧

☐ revised

📖 **DEFINITION**

Public goods — goods & services provided by the government for the benefit of all citizens — roads, bridges, public parks, street lighting, national defence, sanitation; their use by some does not prevent others from using them.

💡 **SAMAJH (HINGLISH)**

Park wali story 🏞️: mohalle me park banwana hai, har family ₹5,000 de. Sab sochte hain — "dus log paise denge toh park ban jayega, main **free me** ghoom lunga!" 😜 Result: paise poore nahi aate, park kabhi nahi banta. Isi ko kehte hai **free-rider problem** — isliye aisi cheezein **sarkar** ko hi banana padti hai. But dhyan — zyada intervention bhi nuksaan karta hai (next points!).

✍️ **EXAM POINTS — PUBLIC GOODS**

- Private companies don't provide them because they **do not generate direct profit**.
- Examples: roads, bridges, parks, street lighting, national defence, sanitation & drainage systems.
- Government provision ensures **social welfare, economic development and equal access** to essential services.

✍️ **EXAM POINTS — LIMITATIONS OF GOVERNMENT INTERVENTION**

- **Price distortions & reduced producer incentives:** if govt fixes wheat at ₹20/kg when market price is ₹30 — farmers receive less → reduced production and shortages.
- **Compliance burdens:** extensive regulations, licenses, permits — e.g., a small restaurant needs food safety, fire safety, pollution control and local clearances; time & cost discourage small entrepreneurs (hurts **ease of doing business**).
- **Discourages innovation & entrepreneurship:** heavy regulation and price controls reduce incentives — farmers won't invest in better seeds or irrigation if returns are inadequate → long-term productivity falls.

🧠 **Last-line for answers:** A democratic government is accountable to the people — it must intervene to protect welfare, but **carefully and in balance**. ✔️

📖 Definition Bank — Chapter 9, Part 1 (likhne ke liye ready) 📖

Demand — quantity buyers are willing & able to purchase at a particular price.

Law of demand — price & quantity demanded move in opposite directions (inverse relation).

Individual demand — one consumer's purchase quantity at different prices.

Market demand — sum of all individual demands at each price.

Demand schedule — table of price vs quantity demanded; **demand curve** — its graph (DD', slopes downward).

Substitute goods — replace each other (tea–coffee); price of one ↑ → demand for other ↑.

Complementary goods — used together (car–petrol); price of one ↑ → demand for other ↓.

Related goods — products whose demand is interconnected.

Purchasing power — how much one unit of currency can buy at a particular time.

Diminishing marginal utility — extra satisfaction from each additional unit falls as consumption increases.

📖 Definition Bank — Chapter 9 (Part 2) 📖

Supply — quantity sellers are willing & able to offer at a particular price.

Market supply — sum of all individual sellers' supplies (A+B+C = QS).

Equilibrium price/quantity — the price (₹100) & quantity (12 kg) at which Qd = Qs.

Price floor — government-set minimum price (e.g., minimum wage); effective above equilibrium.

Public goods — non-excludable goods provided by the government for all (roads, parks, defence).

Black marketing — illegal trade of banned or regulated goods & services.

Law of supply — price & quantity supplied move together (direct relation); supply curve slopes upward.

Market equilibrium — point where quantity demanded = quantity supplied; market is 'cleared'.

Price ceiling — government-set maximum price (e.g., sanitiser cap).

Monopoly — single seller of a unique product, no close substitutes, high price-setting power.

Hoarding — stocking goods beyond need fearing shortages / expecting price rise.

Revenue — total money a business earns from sales before any expenses are deducted.

✅ MCQ Challenge — 10 Questions

🎯 Solve karne ke baad score bharo → _____ / 10

Q1. Demand for a product is best defined as —

a) just the desire to buy something
b) willingness + ability to buy at a particular price
c) the quantity sellers offer for sale
d) money spent on advertising

Q2. According to the law of demand, when the price of a product rises —

a) quantity demanded rises
b) quantity demanded falls
c) supply increases immediately
d) demand becomes infinite

Q3. Tea and coffee are examples of —

a) complementary goods
b) substitute goods
c) public goods
d) luxury goods

Q4. If petrol prices rise sharply, the demand for cars is likely to —

a) rise
b) fall, as they are complementary goods
c) remain exactly the same
d) first rise, then become zero

Q5. The satisfaction from each extra unit consumed keeps falling — this principle is called —

a) law of supply
b) market equilibrium
c) diminishing marginal utility
d) opportunity cost

Q6. The supply curve slopes —

a) downward, like the demand curve
b) upward, showing a direct price–quantity relation
c) in a complete circle
d) horizontally, parallel to the x-axis

Q7. Market equilibrium is the point where —

a) demand is greater than supply
b) supply is greater than demand
c) quantity demanded equals quantity supplied
d) the government fixes the price

Q8. In the chapter's mango example, the equilibrium price and quantity were —

a) ₹40 and 6 kg
b) ₹100 and 12 kg
c) ₹150 and 43 kg
d) ₹50 and 18 kg

Q9. The government's maximum price limit for an essential good (like the sanitiser cap of ₹100/200 ml) is called a —

a price floor
b price ceiling
c market equilibrium
d tariff wall

Q10. Roads, street lights, public parks and national defence are examples of —

a substitute goods
b complementary goods
c public goods
d capital-intensive goods

🔑 Answer Key — Chapter 9

1 → b | 2 → b | 3 → b | 4 → b | 5 → c | 6 → b | 7 → c | 8 → b | 9 → b | 10 → c

- **1:** Demand = desire backed by purchasing power — willingness + ability to buy.
- **2:** Inverse relation: price ↑ → quantity demanded ↓ (mango example).
- **3:** Substitutes replace each other — coffee mehnga → chai ki demand ↑.
- **4:** Car + petrol are complements — used together, so one's price ↑ hurts the other's demand.
- **5:** Each extra unit gives less extra satisfaction — diminishing marginal utility.
- **6:** Higher price → higher profit → more supplied; so the supply curve climbs upward.
- **7:** Equilibrium: Qd = Qs — market cleared, no shortage or surplus.
- **8:** At ₹100, demand 12 kg = supply 12 kg — the equilibrium (point E).
- **9:** Price ceiling = maximum legal price (Essential Commodities Act, COVID case).
- **10:** Public goods — non-excludable, provided by the government for all.

📝 Big Questions — Exam-Ready Answers (points me)

Q1. What is demand? How is it different from mere desire?

ANSWER

- Demand is the quantity of a product that people are **willing and able to buy at a particular price**.
- It depends on the buyer's needs, preferences, season, trend and income.
- Desire alone is **not** demand — it must be supported by **purchasing power** (ability to pay).
- Example: many may desire a luxury car, but only those who can pay create demand for it.

Q2. State and explain the law of demand with the mango example.

ANSWER

- The law of demand states that price and quantity demanded move in **opposite directions** (inverse relationship), other factors remaining constant.
- When price rises, quantity demanded falls; when price falls, quantity demanded rises.
- **Mango example:** at ₹150/kg Srivalli bought 1 kg; at ₹100/kg she bought 2 kg; at ₹50/kg she bought 3 kg.
- Plotting these gives a **downward-sloping demand curve** (DD').
- One reason behind it is **diminishing marginal utility** — each extra unit gives less satisfaction, so willingness to pay falls.

Q3. Explain individual demand and market demand with a schedule.

ANSWER

- **Individual demand** — the quantity one consumer wants to buy at different prices, other factors constant; its table form is the individual **demand schedule**.
- **Market demand** — the sum of all individual demands at each price (Q1 + Q2 + Q3).
- Example: at ₹50 — Srivalli 3 kg + Alex 6 kg + Israt 9 kg = **market demand 18 kg**; at ₹100 it is 12 kg; at ₹150 it is 6 kg.
- Plotting market demand gives the **market demand curve** (DmDm'), which is **flatter** than an individual curve.
- Reason: many consumers respond together, so the same price change creates a **larger total quantity response** (₹150→₹50: individual +2 kg vs market +12 kg).

Q4. Explain the factors (other than price) that influence demand.

ANSWER

- **Price of related goods:** substitutes (tea–coffee) — price of one ↑ → demand for other ↑; complements (car–petrol, printer–cartridge) — price of one ↑ → demand for other ↓.
- **Income:** higher household income → consumers buy more or better quality → demand rises.
- **Taste & preference:** personal likes — Srivalli prefers mangoes even if oranges are cheaper.
- **Population size & composition:** India's huge population boosts demand; more children → sports shoes; working adults → formal shoes; elderly → orthopaedic shoes.
- **Seasonality:** weather, festivals and habits — books in the new session, sweets in festivals, sweaters in winter.
- **Future price expectations:** expected fall → postpone buying; expected rise → buy now (pre-Diwali discounts).

Q5. Distinguish between substitute goods and complementary goods, with examples.

ANSWER

- **Substitutes** can replace each other in use — tea and coffee, mangoes and bananas.
- When the price of a substitute rises, people switch to the cheaper one, so **demand for the related good increases**.
- **Complements** are used together to give utility — car and petrol, printer and cartridges, movie ticket and popcorn.
- When the price of one complement rises, demand for the other **falls** — costlier movie tickets reduce popcorn demand.
- Both show that demand for a good is **interconnected** with prices of related goods.

Q6. What is supply? Explain the law of supply.

ANSWER

- Supply is the quantity of a product that **sellers are willing and able to offer** at a particular price.
- **Law of supply (direct relationship):** as price rises, quantity supplied rises; as price falls, quantity supplied falls.
- Reason: higher prices **increase profitability**, incentivising producers to raise output and attracting new firms.
- Example: seller A supplies 1 kg at ₹50, 2 kg at ₹100, 3 kg at ₹150 per kg of mangoes.
- The supply curve therefore slopes **upward**; market supply = sum of all individual supplies (A+B+C).

Q7. What is market equilibrium? Explain with the chapter's table example.

ANSWER

- Market equilibrium is the point where **quantity demanded equals quantity supplied**.
- Here there is no pressure for prices to change and the market is **'cleared'** — neither shortage nor surplus.
- **Example:** at ₹100, quantity demanded = quantity supplied = **12 kg** → equilibrium price ₹100, equilibrium quantity 12 kg (point E where the curves intersect).
- **Below it (₹40):** Qd 38 kg > Qs 6 kg → **excess demand** — shortage pushes prices up.
- **Above it (₹150):** Qs 43 kg > Qd 8 kg → **excess supply** — surplus pushes prices down.

Q8. Does market equilibrium really exist in the real world? Explain with examples.

ANSWER

- In theory, equilibrium is a fixed intersection of demand and supply — but real markets are **dynamic**.
- Technology, wages, interest rates, wars, political events, pandemics, weather and disasters keep changing demand and supply.
- So equilibrium is **never stable** — markets keep adjusting towards a **new equilibrium**.
- **COVID-19 masks:** demand surged → supply lagged → prices rose → suppliers adjusted → prices fell → pandemic ended → prices returned to normal.
- **Hotel tariffs:** a Goa hotel charges ₹1,500 (off-season weekday), ₹8,000 (December weekend) and ₹25,000 (New Year's Eve), cutting tariffs by 40% overnight when a group cancels — prices move constantly with demand.

Q9. Why and how does the government intervene in the market?

ANSWER

- **Why:** markets allocate goods by ability to pay — essentials may become unaffordable; fairness and equity are needed to protect **vulnerable, low-income groups**.
- **Price ceiling:** maximum price for essential goods (medicines) to prevent overcharging; e.g., sanitisers capped at ₹100/200 ml under the **Essential Commodities Act, 1955** during COVID-19.
- **Price floor:** minimum limit such as **minimum wage**, so workers are not exploited; effective when set above the equilibrium price.
- **Monopoly control:** a single seller can charge higher prices and restrict supply — the government keeps prices and quantity in check.
- **Regulators:** RBI (banking), CCPA (consumer protection), TRAI (telecom), SEBI (securities) ensure transparency and stop unfair practices like **hoarding** and **black marketing**.

Q10. What are public goods? Why must the government provide them, and what are the limits of intervention?

ANSWER

- **Public goods** are goods and services provided by the government for the benefit of all — roads, bridges, parks, street lighting, defence, sanitation.
- Private companies do not provide them because they **do not generate direct profit**.
- **Park example (free-rider problem):** if every family thinks "others will pay, I'll use it free", the park never gets built — so collective goods need government funding.
- **Limits of intervention:** price controls below market levels reduce producers' motivation (wheat at ₹20 vs market ₹30 → shortages).
- Heavy **compliance burdens** (multiple licences for a small restaurant) hurt the ease of doing business.
- Excessive regulation **discourages innovation** — farmers won't invest in better seeds without adequate returns.
